Trusto smart contract solution

Trusto is a blockchain-based distributed infrastructure and operating system featuring **smart contract** and **Biometric functionalities**.

Smart contract protocol intends to digitally **facilitate, verify, and enforce the negotiation, performance, validation** of a contract **without 3rd party**.

Contrary to current smart contract solutions, these transactions are **transparent, auditable, traceable** and **reversible**; working with low fees and energy, which allows compliant industrial applications.

Key features include:

- Oracle database native
- AI foundation
- Transactions recovery
- Lost coins recovery
- Transactions history
- Smart Wallet and biometric smart wallet (directly stored on the Blockchain)
- Smart Management
- Document storage
- Blockchain-based coin storage
- Mediator
- Observer

Additional features include the Biometric Document Blockchain protocol libraries which allows to safely upload and store documents within the blockchain, validate and execute transactions using fingerprints.

Trusto also offers the perfect ecosystem to analyse your data and run Artificial Intelligence algorithms.

Infinite application:

- Blockchain for E-Bank
- Blockchain for Supplier-Buyer contacts
- Blockchain for Exchange
- Blockchain for Trading
- Blockchain for Hospitals
- Blockchain for Lawyers
- Blockchain for Hybrid Exchange pool

A turnkey service

Trusto Implements the execution engine and the run time services of the trusto's smart contracts description language which is a touring complete, declarative, functional language featuring immutable state and formal verification of the contract rules correctness.

Trusto biometric coins (BBC)

With biometric signatures, security is increased and risk to lost coins reduced (no PIN or Password). Users sign on a table, smart phone or any other device. When the biometric signature is verified, they can apply their certificate to the blockchain.
